Use for window this option

The screenshot shows a Stack Overflow page with the URL <https://stackoverflow.com/questions/30374998/run-a-command-shell-in-jenkins>. The page displays 6 answers, sorted by highest score. The top answer, by 'Community Bot', has a score of 70. It provides instructions for running a shell command in Jenkins based on the operating system: 'For Windows slave, please use `Execute windows batch command`. For Unix-like slave like linux or Mac, `Execute shell` is the option.' Below the text is a code block showing a Jenkins build step configuration. A red arrow points to the 'Execute Windows batch command' option in the dropdown menu. The code block contains the following steps:

```
Build
Add build step
Execute Windows batch command
Execute shell
Import developer profile
Inject environment variables
Install Android modules
```

The page also includes a 'Related' section on the right with links to other questions, such as 'How can I execute Shell script in Jenkinsfile?' and 'Build failure while running shell command from Jenkins'. At the bottom, there are links to 'Sign up with email', 'Sign up with Google', 'Sign up with GitHub', and 'Sign up with Facebook'.

Plugins are the additional functionality that will add to the Jenkins.

Green Ball plugin:

Green Balls

Documentation Releases Issues Dependencies

Changes Jenkins to use green balls instead of blue for successful builds.

Greenballs Plugin

Hudson - Green Balls - #7

Build #7 (Feb 27, 2009 7:27:12 PM)

Changes

- [mvn-release-plugin] prepare release 1.0 (2b3b)
- [mvn-release-plugin] prepare for next development iteration (2b3b)

A SCM change trigger started this job

Test Result (no failures)

How To Create Jenkins Job With Parameter | Jenkins Parameterized Build

<https://www.youtube.com/watch?v=-4iMrktR4ZQ&list=PL6fIErFppaj35spJjPy41-lruDjw2kRV-&index=9>

Parameters allow you to prompt users for one or more inputs that will be passed into a build. For example, you might have a project that runs tests on demand by allowing users to upload a zip file with binaries to be tested. This could be done by adding a *File Parameter* here.

Or you might have a project that releases some software, and you want users to enter release notes that will be uploaded along with the software. This could be done by adding a *Multi-line String Parameter* here.

Each parameter has a *Name* and some sort of *Value*, depending on the parameter type. These name-value pairs will be exported as environment variables when the build starts, allowing subsequent parts of the build configuration (such as build steps) to access those values, e.g. by using the `${PARAMETER_NAME}` syntax (or `%PARAMETER_NAME%` on **Windows**).

This also implies that each parameter defined here should have a unique *Name*.

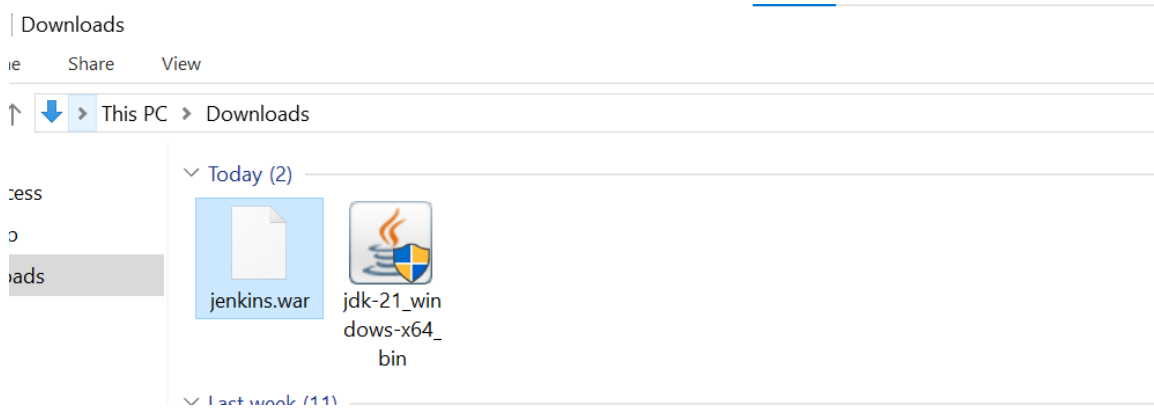

When a project is parameterized, the usual *Build Now* link will be replaced with a *Build with Parameters* link, where users will be prompted to specify values for each of the defined parameters. If they choose not to enter anything, the build will start with the default value for each parameter.

If a build is started automatically, for example if started by an SCM trigger, the default values for each parameter will be used.

When a parameterized build is in the queue, attempting to start another build of the same project will only succeed if the parameter values are different, or if the *Execute concurrent builds if necessary* option is enabled.
